

The Most Popular Technology

Tags: Django, Data

You are given two datasets, Udemy Courses Dataset and Coursera Courses Dataset.

You have to plot the following technologies in a bar plot (like the above) based on two criteria:

- 1) Number of courses about the tech.
- 2) Total number of students learning that tech.

Technologies: Python, Java, Php, JavaScript, Ruby

Bear in mind: courses that mention frameworks should be counted in the base language. For instance, Spring Boot should be counted in Java, and courses that mention NodeJS should be counted in JavaScript, and so on. You can select a few frameworks on your own to include in a categorization.

This should be a web app in Django (a very simple one). You can use the built-in templating system for the frontend. For plotting the graph, use Google Charts. Refer to the documentation of each for details.
