

News App

Tags: **Django** **React** **Consuming APIs**

Objectives:

Get the latest news from the given API.

Show the news on the frontend in a layout like the above.

Instructions:

- You can either use the REST endpoint or the python API client, it's up to you. Refer to the documentation for details on each method.
- **DO NOT** make more than 10 requests to the API. Save the response after fetching once and work with that. The extra 9 requests can be used in case of incorrect responses or missing fields.
- Design the frontend in Django's template language. However, **using React carries bonus points**. Keep an eye on the clock though.
